

Six AI agents that share one memory.

A multi-agent business-intelligence platform for Indian SMBs — where hiring, sales, support and customer care finally recognise the same customer.

Mukul • IIIT-Delhi

with Supriya Bansal • IIT-Delhi

nexflow-ai-india.netlify.app

THE PROBLEM

Six agents that don't share memory are still six silos.

MONDAY

A customer files an angry billing complaint.
Support handles it. Support knows.

TUESDAY

Sales emails that same company an upsell
pitch. Sales had no idea.

Nobody did anything wrong.

The two teams simply cannot see each other.

That isn't a small annoyance — that's how you
lose the account.

So we built a seventh system to fix exactly this.

Seven AI systems. One platform.

6 agents + the Company Brain = 7 AI

CHOOSE YOUR AGENT

Seven AI systems. Pick one to start.

6 agents + the Company Brain = 7 AI

SMB Brain

BUSINESS INTELLIGENCE

Paste raw WhatsApp messages. AI extracts every customer, builds your CRM, FAQ and sales pipeline automatically.

WhatsApp CRM · tier-2 India · ROI

START HERE

HireFlow AI

HIRING INTELLIGENCE

7 AI agents rank resumes, draft outreach emails, generate interview questions and audit bias — from a single JD paste.

7 agents · real scoring · bias audit

SalesFlow AI

AUTONOMOUS SALES

AI builds Indian B2B prospect lists, writes personalized cold emails, and handles live objections — even in Hindi.

Prospects · cold email · objection AI

SupportFlow AI

SUPPORT INTELLIGENCE

Paste your docs once. AI builds a knowledge base and answers every customer question using only your content.

KB builder · sentiment · CSAT

CareFlow AI

CUSTOMER CARE

AI reads tickets, scores urgency, picks the right tone, and drafts replies. You approve before anything sends.

Triage · SLA timer · human approval

AI War Room

MULTI-AGENT CONTROL

Every operational agent fires simultaneously. Agents debate, hand off work to each other, and produce one unified report.

Parallel · cross-agent · live debates

Company Brain

SHARED MEMORY

One memory every agent shares. The same person seen by sales and support becomes one record — and the Brain tells you the cross-team move to make next.

Identity resolution · timeline · next-best-action

Company Brain

Shared memory — the glue

Team is an admin feature, not an AI system — kept separate on purpose. We don't inflate the count.

THE IDEA

Every agent reads the shared memory before it acts.

They write to it — and read from it before they draft.

Live demo — four things

1

CareFlow

A real customer complaint lands. Care logs it.

2

SalesFlow

Sales targets that same customer — and the Brain stops them.

3

Company Brain

Two records become one. Ranked cross-team actions.

4

Proof

The deterministic engine, run live in the terminal.

3

Outreach

Personalized emails

Outcome-learning loop active — these emails were nudged toward openings that converted across 7 past outreach outcomes. Improves as real replies are recorded.

✳️ WRITTEN KNOWING — Company Brain account check

⚠️ Raj Patel at this account has an OPEN support ticket — coordinate with Care first

Hi Ananya,

I noticed UrbanCart might be dealing with Manual hiring taking 3+ weeks.

• Net-new account — no prior contact across any team

Hi Rohan,

Exact contact match

Priya is already known to Care — and has an open complaint. Align before pitching.

Account-level match

Ananya is brand new — but her colleague has an open ticket at the same company.

Net-new — and it says so

When there is genuinely no history, it tells you.
No invented intelligence.

Two records became one.

NexFlow

Company Brain
Shared cross-agent memory

Shared memory

IN HI

SHARED MEMORY

One brain. Every agent. No silos.

Six agents. One memory.

The same person shows up in sales, support and hiring as three disconnected records. The Brain merges them by email, phone, then name — then tells you the cross-team move to make next. SalesFlow and CareFlow read this memory **before** they draft.

HIGH

“Resolve the open complaint
before sales pitches an upsell”

The Brain decides. The model drafts.

Deterministic core

- Identity resolution and every recommendation are pure functions
- Same input produces identical output, every run
- Fuzzy matching: “Raj Patel” = “Rajesh Patel” at one domain — two different colleagues never merge
- Reproducible in 2 seconds, no API key needed

Probabilistic layer

- Llama 3.3 70B via Groq writes the actual copy
- It receives the Brain's facts as injected context
- A human approves before anything is sent
- If the model is down, the safety check still fires

That separation is why a rate-limited model cannot cause a bad business decision.

Measured against the live model.

4.4 s

full four-call run

₹0.096

measured cost of this run

128

tests · 11 suites · CI on every push

Reproducible: `node scripts/real-run.mjs` — writes the log straight into the README.

What does it actually cost to run?

₹0.19

per full HireFlow pipeline run
(8 Groq calls)

Computed from Groq's published pricing
and our own token tracking — not an
invented marketing figure.

NOT A WESTERN TOOL WITH A RUPEE SIGN

Built for how India actually works.

1

Compliance by Indian law

Deterministic JD checks written against the Equal Remuneration Act, POSH Act and Code on Wages.

2

PAN • GSTIN • Udyam

Structural and checksum validation, verified against the standard public GSTIN vector.

3

Hinglish, not translation

The AI answers in natural Roman-script Hinglish, the way Indian professionals write.

4

WhatsApp-native

Tier-2 businesses live on WhatsApp. SMB Brain turns raw chats into a structured CRM.

5

DPDP Act, 2023

A real data-subject deletion function, with cascade behaviour documented.

6

Priced in reality

₹999–₹2,999/month against ₹190 of monthly compute at high usage.

Two production bugs, caught before a judge did.

42P17 • RLS infinite recursion

Multi-tenancy policies queried the employees table from inside a policy on that same table. Postgres aborted every query, so every database write in production was silently failing while the interface reported success.

22P02 • invalid numeric input

A word like “negative” reaching a numeric sentiment column made Postgres reject the entire insert. The ticket never saved — and the interface still showed success.

Both were invisible from the UI — the code degrades gracefully instead of crashing.

Fixed with SECURITY DEFINER functions — the correct Postgres pattern for self-referential membership tables — and input coercion, each with a regression test so neither can return silently.

We would rather find these ourselves than have them found for us.

We publish the gaps too.

Company Brain engine

Unit-tested plus a reproducible scenario. Same input, same output.

The closed loop, in-app

Visible in CareFlow and SalesFlow; context injected into the live prompt.

Live Groq API run

Four real calls — latency, tokens and cost measured and logged.

LLM judgement calls

Bias scores and sentiment are drafts for human review, not certified results.

Real customer data

Inputs are still project-authored. Not yet run on a real business's records.

The red row stays red until it's earned. That's why you can trust the green ones.

Thank you.

Six agents that don't share memory are still six silos.

NexFlow AI gives them one.
